(54) FILE SAVING SYSTEM

(57)Abstract:

PURPOSE: To improve the availability of the file resources and at the same time to facilitate the control of a saved file by connecting the file saving store files to each other in a full saving and update saving states.

CONSTITUTION: A file control information saving means 2 is provided together with a saving file deciding means 3, and a file data saving means 4. The relative position information included in a store file 71 for saved files is registered into a table 6. Then the file data saved previously into a store file 71 is rewritten with the file data to be saved this time in an update saving state after a full saving state. Thus the store file produced in the full saving state is connected to the store file produced in the update saving state for production of the file 71. As a result, just a single file 71 that is produced in the full saving state is required to each user. Thus the duplication of file data is eliminated and the file resources can be effectively used. At the same

time, the files 71 are easily controlled.

LEGAL STATUS [Date of request for examination]

[Date of sending the examiner's decision of rejection]

[Kind of final disposal of application other than the examiner's decision of rejection or application converted registration]

[Date of final disposal for application]

[Patent number]

[Date of registration]

[Number of appeal against examiner's decision of rejection]

[Date of requesting appeal against examiner's decision of rejection]

[Date of extinction of right]
